

Cerebral Palsy Therapy

Results

Cerebral Palsy Therapy Results

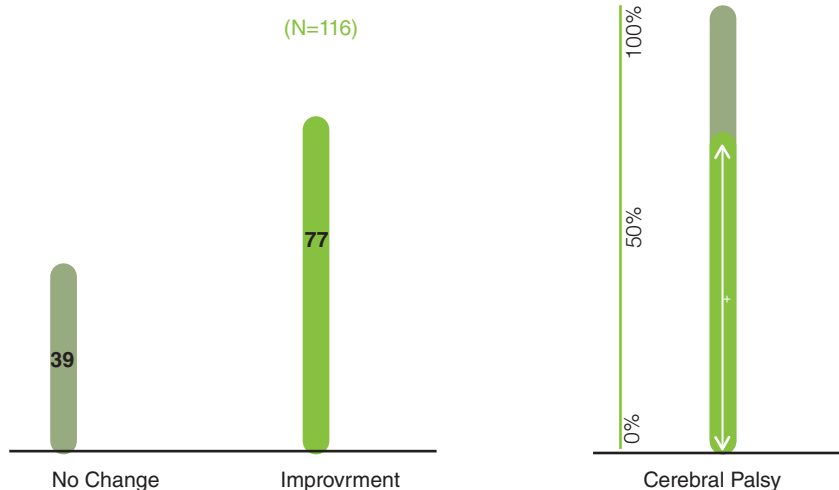

A total of 116 patients suffering from cerebral palsy went under Stem Cells Therapy and were evaluated post-therapy. We observed clinical improvements in 66.4% of the patients.

Improved motor functioning along with decreased spasm problems and a resultant improvement in the ability to sit, stand and walk was the major achievement. It was observed that the therapy augmented posture stability and mental functioning leading to better communication.

Betterment of speech was noticed in 28 patients. A massive reduction and even non-occurrence of epileptic seizures was reported in 11 patients, in total, during the follow-up in post-therapy period.

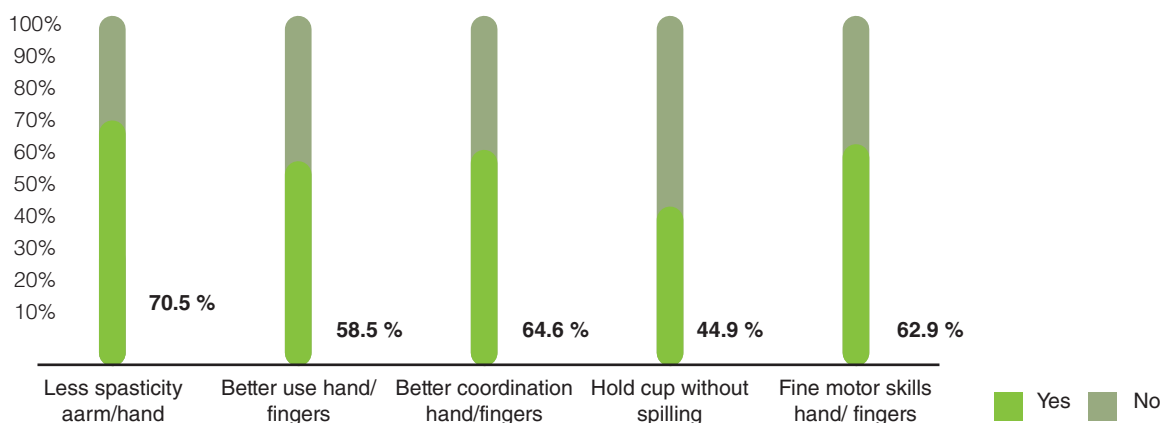

The improvements in 90% of the patients were noticeable in 8 weeks post-therapy with the autologous stem cells.
