Diabetic Foot Therapy

Results

Patients, who have undergone a PRP therapy with Advancells for their wounds such as diabetic foot have acquired a very fast recovery. All of them were suffering from non-healing diabetic foot during their late 50's as a major complication of Diabetes. Since the management of the wound in diabetic patients is very poor and painful, a kind of advanced technology was suggested for them as a therapy to manage the problem; which can easily take over to traditional options such as surgeries, debridement, antibacterial actions etc. A PRP was isolated from the peripheral blood of all the patients and injected around the wound through microneedles. The results showed that 100% ulcers completely closed after about 7-8 weeks. Although, patients' response to the wounds was not typical; no adverse effect has been observed till now. The method is completely authentic, approved by the regulatory authority as a novel and minimally invasive method.
